

Asset Management

If the circuit data is available you can compare the downstream load of transformers to it's rated load. Transformer load values can be accurately gathered (or estimated) and used to prevent transformer damage and to make purchasing decisions based on this load information. This module allows you to consider the transformer 'system' as a whole or to gather this information about individual transformers.

Meter Auditing

Limit potential customer or revenue problems due to malfunctioning equipment, missing AMI data, or loss due to theft or administrative errors. The USSI MDM solution helps identify active metered accounts that have ceased reporting, never reported, or show unusual consumption patterns that indicate that a customer may have an appliance issue or installed meter issue.

Revenue Protection

Utilities experiencing loss due to faulty or aging equipment or potential theft benefit from this module (coupled with specialized AMI equipment). Use information concerning unmeasured load, line loss, circuit/transformer monitoring to see estimates of Non-Technical losses and then make informed decisions on mitigating such.

Complex Billing Determinants

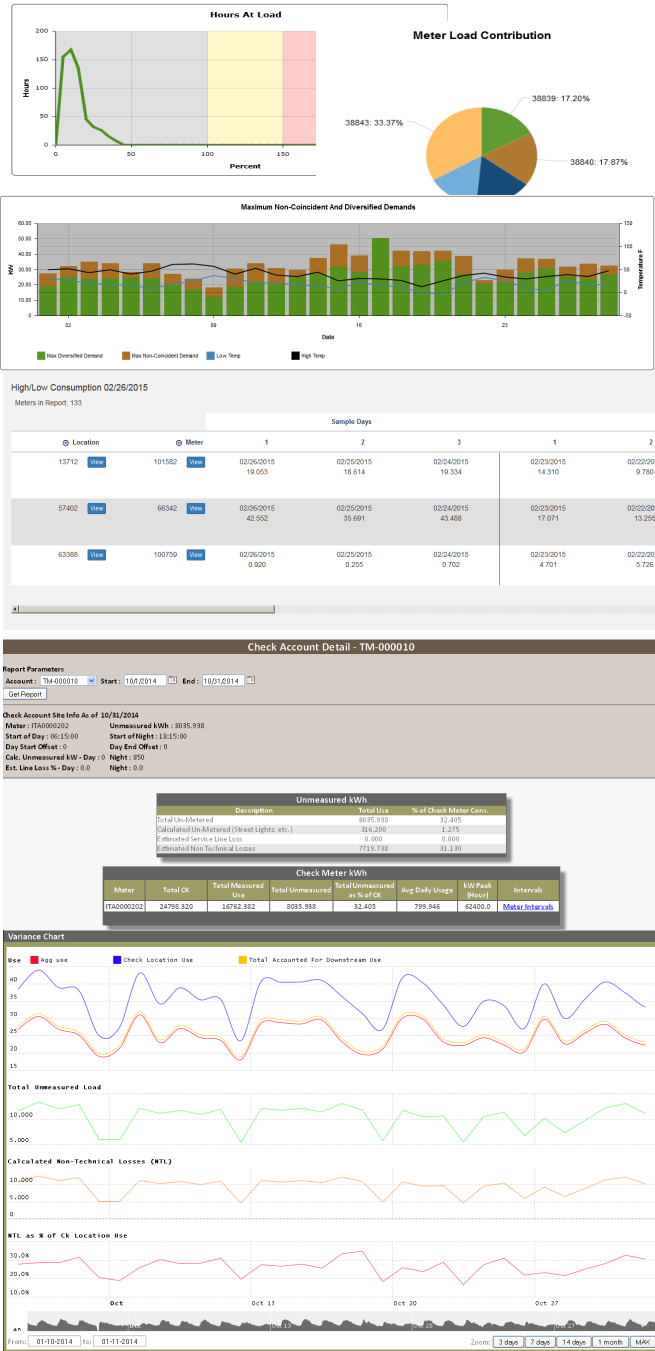

The USSI MDM supports complex billing such as Time of Use, Critical Peak and Demand billing. The Time of Use feature allows a utility to easily configure seasons and schedules as-well-as the ability to use supplier peak information.

Accurate Billing Estimates

The USSI MDM can provide both interval and midnight register estimates and provides exception reports of all estimates made of inestimable values. The system will also mark estimates in the CIS through the MultiSpeak interface.

Need we say more? - Yes!

Schedule a demo with us so we can show you the full system. Allow us to explain why the USSI MDM solution is a good fit for you! Let us describe how we back this up with our customer support and service.
